AUTO TICKET CLASSIFICATION USING FLOW DESIGNER

PHASE 2: REQUIREMENT ANALYSIS

1. INTRODUCTION

The Auto Ticket Classification using Flow Designer project aims to automatically classify Service Now tickets based on the information provided in the ticket. This reduces manual work and helps route tickets to the appropriate category or support team.

2. FUNCTIONAL REQUIREMENTS

The system should be able to:

1. Detect when a new ticket is created.
2. Read the ticket details such as short description, description, category, and priority.
3. Check the ticket information against predefined conditions.
4. Identify the appropriate ticket classification.
5. Automatically update the ticket category or subcategory.
6. Assign the ticket to the appropriate assignment group when required.
7. Handle tickets that do not match any predefined condition.
8. Allow administrators to monitor the flow execution.

3. NON-FUNCTIONAL REQUIREMENTS

The system should provide:

- **Accuracy:** Tickets should be classified according to the defined conditions.
- **Reliability:** The flow should execute correctly whenever the required trigger conditions are met.
- **Efficiency:** Automation should reduce the time required for manual ticket classification.
- **Maintainability:** Conditions should be easy to modify when requirements change.
- **Usability:** The workflow should be simple for administrators to understand and manage.
- **Security:** Only authorized users should be able to configure or modify the automation.

4. INPUT REQUIREMENTS

The system may use the following ticket information:

- Ticket/Incident Number
- Short Description
- Description
- Category
- Subcategory
- Priority
- Caller/User Information
- Assignment Group

5. TICKET CLASSIFICATION REQUIREMENTS

The system will classify tickets based on predefined conditions.

TICKET INFORMATION	CLASSIFICATION
Laptop or desktop issue	Hardware
Password or login issue	Access
Email-related issue	Email
VPN or network issue	Network
Application or software issue	Software

These classification conditions can be modified according to the project requirements.

6. OUTPUT REQUIREMENTS

After processing the ticket, the system should:

1. Identify the ticket type.
2. Update the required classification field.
3. Set the appropriate category or subcategory.
4. Assign the appropriate support group when required.
5. Keep the ticket available for further processing.

7. TECHNOLOGY REQUIREMENTS

REQUIREMENT	TECHNOLOGY
Platform	ServiceNow

REQUIREMENT	TECHNOLOGY
Automation Tool	Flow Designer
Main Record	Incident/Ticket
Logic	Conditions / If-Else
Testing	Service Now Simulator
Documentation	Microsoft Word / PDF
Project Repository	GitHub
Demo Video	Google Drive

8. USER REQUIREMENTS

The main users of the system are:

- **Service Desk Agents:** Receive properly classified tickets.
- **Support Teams:** Handle tickets according to their classification.
- **Service Now Administrators:** Configure and maintain the flow.
- **End Users:** Create support tickets.

9. SYSTEM CONSTRAINTS

The following constraints should be considered:

- Classification depends on the conditions defined in Flow Designer.
- Incorrect or incomplete ticket information may result in incorrect classification.
- Required Service Now permissions must be available.
- The flow must be properly configured and activated.
- Classification rules must be clearly defined before development.

10. EXPECTED RESULT

The expected result is an automated ticket-classification process. When a new ticket is created, Flow Designer checks the ticket information, identifies the appropriate classification, and updates the required ticket fields automatically.

11. PHASE 2 CONCLUSION

The Requirement Analysis Phase defines the functional requirements, non-functional requirements, inputs, outputs, users, technologies, and system constraints of the project.

These requirements provide the foundation for the **Project Design Phase**, where the system flow, classification logic, and overall design will be prepared.
